

# Environment Variables in Katana

## Installation Path Variables

You will need to set a few environment variables to get RfK up and running with PRMan and Katana. RfK looks for RenderMan on the \$RMANTREE environment variable. As long as \$RMANTREE is set correctly, RfK will find the appropriate PRMan libraries and commands. Katana finds RfK in the same way it would find any other plugin - through the \$KATANA\_RESOURCES environment variable. The paths for these environment variables will depend on whether you install RfK/PRMan in the default locations or not.

Environment Variable	Default Installation Paths
<b>RMANTREE</b>	/opt/pixar/RenderManProServer-22.0
<b>KATANA_RESOURCES</b>	/opt/pixar/RenderManForKatana-22.0-katana2.6/plugins/Resources/PRMan22

Default shader search paths for RenderMan match the default paths in the rendermn.ini file. If additional search paths are needed then you will need to set up the RMAN\_SHADERPATH and/or RMAN\_RIXPLUGINPATH environment variables to include your specific paths.

## Output Path Variable

You can direct the render log output to another location if necessary using the following environment variable: RfK\_REDIRECT\_OUTPUT

## Shader Discovery

During startup RenderMan for Katana will automatically load all "discoverable" shaders. Shaders are discoverable if they are found in a search path and (for non-OSL shaders) have an associated Args file. The standard shader search path mechanism is used when searching for shaders with search paths specified either with PrmanGlobalStatements settings or environment variables:

ShaderType	Environment Variable	PrmanGlobalStatements attribute	Default Path
<b>OSL</b>	RMAN_SHADERPATH	options.searchpath.shader	\$RMANTREE/lib/shaders
<b>Plugin (C++)</b>	RMAN_RIXPLUGINPATH	options.searchpath.rixplugin	\$RMANTREE/lib/plugins

If both the environment variable and the attribute are set the resulting search path will be the union of the two strings.

## Recursion

RfK will automatically recurse down a shader path to find shaders in subdirectories. By default it will recurse down 3 subdirectories. This is configurable using the shaderPathRecursionLimit setting in the RfK config file, config.xml.

## Args Files

The args files need to be in an Args directory. See the setup in RMANTREE/lib/plugins for an example. Something like this:

RMAN\_RIXPLUGINPATH directory:

\$RMAN_RIXPLUGINPATH/pattern_remap.so
\$RMAN_RIXPLUGINPATH/Args/pattern_remap.args

You can find out more about Args files in the developer docs [download](#).
