# **Linux License Server**

If you installed the License Server using the RenderMan Installer then you already have the pixar.license file you need in:

/opt/pixar/pixar.license

If you installed by downloading and running the .rpm then after the installation run the Pixar LicenseApp as a root users or with sudo, which is normally done this way:

sudo /opt/pixar/PixarLicense-LA-23.0/LicenseApp/bin/LicenseApp

This will help you download and install the license file for the license server. When LicenseApp discovers there is no license file on disk, it will look like:

Click the "Get License" button to download a new license file for the license server. It will place this license file in:

/opt/pixar/pixar.license

If you do have a license, but the license server has not yet been started, RenderMan will report a license error:

R50005 {SEVERE} License error - code 111: connect Connection refused R50005 {CONTINUED} license source: 9010@mylicserver

If you then run the LicenseApp, it will likewise report that it was not able to run contact the license server.

The LicenseApp is a useful tool for indicating the current state of your license server, it can be run on the client machines as well and will remotely query the server for its status.

### Setting up the License Service on Linux

Before the License Server can be started, it must be installed as a service on the Linux machine that the floating license is keyed to. To do this, execute the following command in a shell window:

sudo bash /opt/pixar/PixarLicense-LA-23.0/linux\_installService.sh

#### Starting the License Server

NOTE: You must setup the license service using the command outlined above to ensure that the service can be easily started, stopped, or restarted.

To start the license service, execute the following command in a shell window:

sudo service pixar-license start

When the License Server is running correctly, the LicenseApp program will display information about license features and the counts:

r Pixar LicenseApp _ 🗆 🗙						
Host Info						
Source stub file Hostname tipa		Location 9010@gambino.svpn.pixar Host ID 2c27d7ef4bb7,2c27d7ef4bb6				
License Info						
Serial Number not applicable License Type floating			Host ID 003ee1c554d3 Server gambino			
feature		version	expires	used	total	
RPS-21.0 PhotoRealistic-RenderMan RMSslim RMS-19.0 RPS-18.0 RPS-17.0 RMS-21.0 RMSsit		1 21 21 1 1 1 21 21	11-aug 11-aug 11-aug 11-aug 11-aug 11-aug 11-aug 11-aug	0 0 0 0 0 0	10 10 10	
count user	host	pid	version	when	luratior	
Get License						

RenderMan and other plugins should then run as expected.

## Stopping the License Server

If you need to stop the license service for some reason, execute the following command in a shell window:

```
sudo service pixar-license stop
```

When the License Server is no longer running, the LicenseApp program will display that information:

RenderMan and other plugins will no longer execute.

#### **Restarting the License Server**

Every time you update your license file, you will then need to restart the license service to pick up the new license contents. The license can be restarted by typing the following into a shell:

sudo service pixarlicenseserver restart

The license server is installed, by default, in /opt/pixar/PixarLicense-LA-<version> and contains the following components and scripts:

- **PixarLicenseServer** the license server program
- LicenseApp/bin/LicenseApp the license status application
- queryPRMan.py an example python script for querying the license server
  linux\_installService.sh a script used by the installer to setup the license server system service
